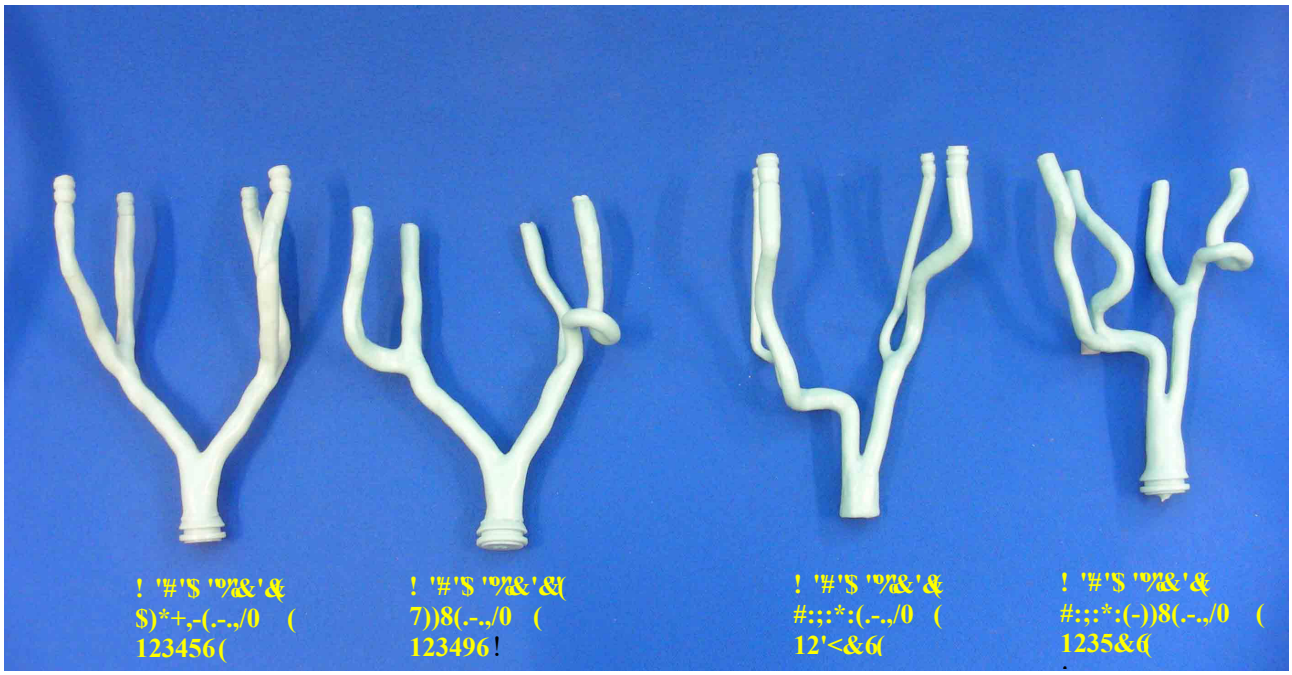
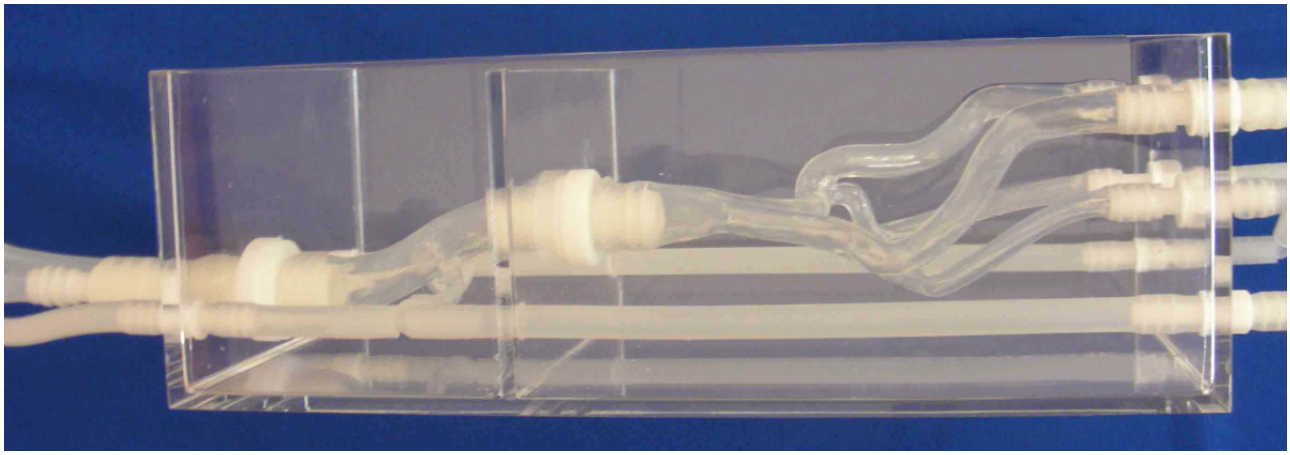
Various exchangeable Iliacs for Abdominal A-S-N-001+ model



Side view of the A-S-N-001 model with its tortuous abdominal iliacs



ELASTRAT in vitro models respect human anatomy and are designed for the development and demonstration of stents, coïls and catheters. They provide a realistic environment for the simulation of endovascular procedures, pre-surgery training, studies and teaching purposes for interventionists.

ELASTRAT replicas are compatible with modern imaging modalities such as digital subtraction angiography, computed tomography and magnetic resonance imaging. Providing the use of an adequate circulating fluid, Doppler techniques can also be performed. The in vitro models transparency to light makes them suitable for video and photographic monitoring.
